# StudyVault

*An AI-Powered Study Material Organizer for Mobile*

**M. A. O. Rodrigo**  
**FC221019**

**T. G. Kithmi Pabodha**  
**FC222051**

**M. D. C. E. Gunathilaka**  
**FC222044**

WHY THIS APP IS NEEDED

# The Problem Students Actually Face

## 1 Materials Are Scattered

PDFs, slides, and photographed handwritten notes spread across WhatsApp, Google Drive and local storage.

## 2 Disorganized & Duplicated

No centralized structure means poorly named, scattered, duplicated files that are hard to relocate.

## 3 Critical During Exams

Quick access to the right material matters most exactly when students have the least time to search for it.

## 4 No Intelligent Understanding

Existing tools (Drive, plain file managers) only store files — none summarize or prioritize content for you in crucial moments.

# Project Objectives

## Primary Objectives

- Centralized platform to store and organize study material (PDFs & images)
- Enable students to manage files efficiently
- Integrate AI-powered summarization for quick understanding

## Secondary Objectives

- Allow students to mark important notes
- Enable secure user authentication
- Reduce time spent searching for and reading materials
- Help students revise using AI-summarized notes and quizzes

BRIDGING PROBLEM TO PRODUCT

## Our Solution & Scope

*“A centralized vault for academic files, with AI built in to help students understand them faster.”*

- Platform: Android, built with React Native + Expo
- Satisfies core requirement: functional app, 9 screens, local + firestore data storage
- AI integration is central to the app, not an add-on feature

HOW THE PIECES FIT TOGETHER

# System Architecture

**React Native / Expo**  
**Frontend**

UI, navigation, 9 screens, theming

**Firebase**  
**Auth + Firestore**

Users, notes & folder metadata

**Gemini 2.5 Flash**  
**Google AI API**

Summarization + quiz generation

## Local Device Storage (expo-file-system)

Actual PDF/image files live here on-device — not inside Firestore. Firestore only stores a relative path reference to each file.

# Frontend

## 9 Screens

- ▶ Login
- ▶ Register
- ▶ Home
- ▶ Add Note
- ▶ Note Detail
- ▶ Folder Detail
- ▶ Profile
- ▶ Change Password
- ▶ Quiz

### App-Wide Theme System

ThemeContext + AsyncStorage persistence. Every screen uses a `createStyles(colors)` function — dark/light mode is a real architectural decision, not one hardcoded screen.

### Search & Sort

Notes searchable by title, folders by name — ranked so titles starting with the query appear before ones that merely contain it.

### Organization Tools

Pin important notes, group into folders, rename notes/folders, duplicate-title prevention.

# Backend

## Authentication

Firebase Auth — email/password sign-up & login, session persistence, password change with re-authentication.

## Firestore

Notes (title, type, pinned, summarized, summary, createdAt, filePath), folders (name, noteIds[]), and users collections.

## Full CRUD

Create, read, update, and delete implemented for notes, folders, and profile — using addDoc, updateDoc, arrayUnion/arrayRemove, deleteDoc.

## Local File Storage

expo-file-system manages actual PDF/image bytes on-device, referenced by relative path in Firestore.

# AI-Powered Summarization

## MODEL

Google Gemini 2.5 Flash  
(generateContent REST endpoint)

## PURPOSE

Turn an uploaded PDF or image into a structured, exam-useful summary

## INPUTS

The uploaded file (base64) + note title

## OUTPUTS

Structured JSON: overview, key topics, formulas, worked example

## No OCR, No Native Modules

The file is sent as base64 inline\_data directly to Gemini, which reads PDFs and images natively in the same call that generates the summary — no separate OCR/extraction step, no native libraries incompatible with Expo Go.

## Enforced JSON, Not Markdown

A strict responseSchema forces Gemini to return real JSON (overview, keyTopics[], keyFormulas[], workedExample[]) instead of formatted text. Enforced by the API itself, so the UI renders it directly — no markdown parsing, nothing can render broken.

# AI-Generated Revision Quizzes

- Reuses the summary already produced — never re-reads or re-uploads the original file
- Cheaper and faster: one small text-only call instead of a full document call
- Automatically includes numeric/calculation questions when the summary has formulas or worked examples
- Same architectural pattern as summarization (schema-enforced JSON output) — a designed system, not two disconnected features

# Additional Features

## Search files & folders

Search functionality to find files and folders by name

## Consistent Theming

Implemented both Light and Dark mode within app to support user friendliness

## Share & Download

Export summaries via native share sheet or save-to-device (expo-sharing)

## Profile Management

Editable profile, picture upload with cropping, secure account deletion (re-auth required)

## Quiz generation

Generate small quiz on the note based on AI summary

PROBLEM-SOLVING, NOT JUST BUILDING

# Challenges & How We Solved Them

|                                      | Challenge                                                                                                  | Solution                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Native libraries vs. Expo Go</b>  | OCR/PDF-parsing native modules require ejecting from Expo Go.                                              | Send files directly to Gemini as inline data — extraction happens inside the AI call itself.                                      |
| <b>Hidden “thinking tokens”</b>      | Gemini 2.5's internal reasoning tokens were silently eating the visible output budget, truncating results. | Capped <code>thinkingConfig.thinkingBudget</code> and raised <code>maxOutputTokens</code> so summaries/quizzes never got cut off. |
| <b>Storage cost on the free tier</b> | Storing large binary files in Firestore Storage burns through free-tier limits fast.                       | Hybrid model: metadata in Firestore, actual files kept in local on-device storage.                                                |

# Live Demonstration

Register/Login → Upload → Organize → Summarize → Quiz → Share

WHERE WE'D TAKE IT NEXT

# Future Improvements

1

## Push Notifications

Move beyond in-app alerts to real device push notifications

2

## Cloud Backup & Sync

Back up local files to the cloud and sync across devices

3

## OCR Fallback

Support scanned handwritten notes as a fallback extraction path

4

## Cross-Device State Sync

Sync pinned notes and folder structure across a student's devices

# Thank you!
